What should an EEG pretext task predict?

Masked EEG input

patchify + embed

same masking for every model

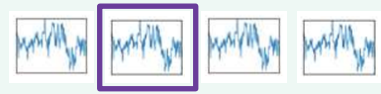

same architecture

Transformer encoder

LaBraM

Discrete code

index in a separately trained VQ codebook

codebook index k

target defined by a tokenizer, not by the signal's physics

CBraMod · CSBrain · REVE

Raw waveform

every sample of the masked patch

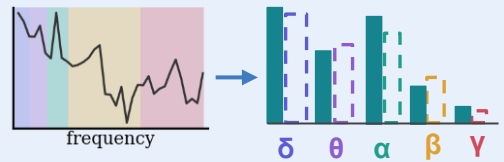

200 samples

spends capacity on phase and noise that context cannot predict

SpecBraM (ours)

Band power

log power of the masked patch in five bands

phase-free, from the patch's spectrum

learns the spectral state that EEG labels are defined by
